# CareBridge Relay

Exchange Data Easily and Securely

One of the major obstacles to setting up an interface with a trading partner is the combination of configuration and security required for the communication itself. It is not uncommon for interface projects to be delayed or cancelled because of this, even when the two entities agree that it is in their best interest to share data and collaborate.

eMedApps CareBridge Relay takes the headaches out of connecting your systems. No need to setup a VPN or make configuration changes to your firewalls or security settings. CareBridge Relay allows organizations to connect and exchange data, securely, over the internet and does not require additional hardware.

Using our CareBridge Relay with our CareBridge Interface Engine allows you to connect to any number of remote sites and organizations with whom you collaborate and the CareBridge Relay makes it easy for both parties to connect.

Why should I consider using CareBridge Relay?

- Allows rapid deployment and faster realization of the benefits of sharing data
- Architect a solution using CareBridge Relay that does not require a VPN or configuration changes
- Data is delivered by calling a central server web service
- HTTPS is used to securely transfer data, the same technology used by credit card companies and banking institutions for online transactions
- Easy to add new connections or update configurations
- The CareBridge Relay will automatically startup whenever there is a system reboot or update
